- (54) Title: 1,3-DISUBSTITUTED UREAS AS ACAT INHIBITORS, AND METHOD OF PREPARING THEREOF
- (57) Abstract

The invention relates to 1,3-disubstituted ureas of general formula (I) where  $R^1$  is an aryl,  $R^2$  is nitro and/or amino, and X is oxygen and/or sulfur, and the method of preparing thereof which consists in treating aromatic amines with isocyanates. Isocyanates may be formed in situ and the reaction carried out in toluene, at 80  $^{\circ}$ C. If the nitro group is formed, it is reduced

with hydrogen in the presence of palladium catalyst to the amino group. The obtained 1,3-disubstituted ureas are inhibitors of the activity of the acyl co-enzyme A: cholesterol acyltransferase (ACAT) enzyme, and may be used to inhibit cholesterol esterification and absorption in hypercholesterolemia.

# 1,3-Disubstituted Ureas as ACAT Inhibitors, and Method of Preparing Thereof

# **Technical Field**

The invention relates to compounds the principal characteristics of which include inhibition of the acyl-coenzyme A: cholesterol acyltransferase (ACAT) enzyme activity, and to a method for the preparation of such compounds.

# **Background Art**

The acyl-coenzyme A: cholesterol O-acyltransferase (EC 2.3.1.26) (ACAT) enzyme is responsible for the catalysis of the intracellular esterification of cholesterol. ACAT is present in most tissues such as the intestine, liver, and arterial wall. The enzyme is assumed to be involved in numerous processes which underlie the development of atherosclerosis, absorption of dietary cholesterol, accumulation of cholesterol esters, hepatic secretion of cholesterol esters into the blood plasma in the form of VLDL cholesterol.

A number of substances of the urea type have been described to inhibit ACAT. We shall show several more recent examples describing 1,3-disubstituted ureas as ACAT enzyme inhibitors. Patents EP 506532, FR 2674522, JP 93097802, US 5219859 describe ureas containing indole derivatives in their molecules. A combination of aromatic and aliphatic moieties has been described in Patents EP 665216, JP 95258199. Introduction into the molecule of a 1,3-dioxolane ring has been reported in Bioorg. Med. Chem. Lett. 1995, 5(15): 1581.

1,3-Disubstituted ureas of the present invention have not been described in literature.

## Disclosure of Invention

1,3-Disubstituted ureas of general formula I,

$$R^1$$
 $NH$ 
 $NH$ 
 $NH$ 
 $X=0, S$ 
 $R^2=NO_2, NH$ 

wherein R<sup>1</sup> is 4-nitrophenyl, 2-fluorophenyl, 4-fluorophenyl, 2,4-difluorophenyl, 2-chlorophenyl, 4-chlorophenyl, 2,3-2,6-difluorophenyl, 2,5-difluorophenyl, dichlorophenyl, 2,4-dichlorophenyl, 2,6-dichlorophenyl, 3,4-dichlorophenyl, 3,5-2,4-dimethylphenyl, 2,6-4-methylphenyl, 2-methylphenyl, dichlorophenyl, dimethylphenyl, 3,5-dimethylphenyl, 2,6-di(methylethyl)phenyl, 2-trifluoromethylphenyl, 3-trifluoromethylphenyl, 4-trifluoromethylphenyl, 2-pyridyl, 3-pyridyl, 4pyridyl, 1-naphthyl, 2-naphthyl, 1-adamantyl, and  $R^2$  is nitro, and X = O, S; and for R<sup>1</sup> being 2,4-difluorophenyl, 2,3-dichlorophenyl, 2,6-dimethylphenyl, 2,6-di-(methylethyl)-phenyl  $R^2$  is amino, and X = 0, S.

The method for the preparation of the above compounds according to this invention consists in reacting an isocyanate (as prepared in situ or as commercially available) with amine to give an urea the nitro group of which may subsequently be reduced to the amino group. Ureas prepared in this way show inhibitory effect on acyl-coenzyme A: cholesterol acyltransferase (ACAT).

### **Examples**

### Example 1

1-(4-Nitrophenyl)-3-((-4 'nitrophenoxy)-phenyl)-urea

A solution of 4-nitrophenylisocyanate in diethylether (20 ml) is added dropwise to a solution of 4'-nitrophenoxy-aniline (2.30 g, 0.01 mol) in a mixture of diethylether (20 ml) and tetrahydrofurane (20 ml) at laboratory temperature, and the mixture is stirred for 16 hours. The precipitated product is aspirated, washed with diethylether (20 ml). The raw product is purified by chromatography on silica gel eluting with dichloromethane-methanol.

#### **Tests**

The biological activity of the substances was evaluated based on the in vitro inhibition of acylCoa:cholesterol acyltransferase (ACAT) activity. The enzyme was obtained from the microsomal fraction of rat liver cells and rabbit intestinal mucosa of animals fed with cholesterol. The substrates for the enzyme reaction included exogenous oleoyl co-enzyme A and endogenous cholesterol. <sup>14</sup>C-oleoyl co-enzyme A conversion to <sup>14</sup>C-cholesteryl oleate was monitored. From the mixture of extracted lipids, cholesteryl oleate was separated using thin-layer chromatography, and was quantified radiometrically. ACAT specific activity was expressed as the amount of cholesteryl oleate formed per minute per mg microsomal protein.

Table 1 shows percentages of ACAT inhibition in the rat liver and the rabbit intestinal mucosa at various concentrations of the substances tested. Efficiency was calculated as compared to enzyme activity measured in the presence of 1% dimethylsulfoxide used as the solvent to prepare solutions of the substances tested.

# **Industrial Applicability**

The compounds according to the invention and the method of preparing thereof can be used in pharmaceutical production to make preparations with inhibitory effect on the enzyme acyl co-enzyme A and on cholesterol absorption in hypercholesterolemia.

### CLAIMS

1. 1,3-Disubstituted ureas of general formula I,

$$R^1$$

wherein  $R^2$  and X have the above defined meanings, is treated with an isocyanate of general formula III,

$$R^1 - N = C = O$$

wherein R<sup>1</sup> has the above defined meaning, said isocyanate optionally being formed in situ from appropriate reactants,

thus giving the above defined urea.

- 3. The method of claim 2, characterized in that when said isocyanate is formed in situ, the reaction is carried out in toluene at about 80°C.
- 4. The method of any of the preceding claims, characterized in that the obtained 1,3-disubstituted urea of general formula I wherein R<sup>2</sup> means nitro, is treated with hydrogen in the presence of palladium catalyst to reduce the nitro group to the amino group.
- 5. 1,3-Disubstituted ureas of general formula I, according to claim 1 and/or prepared by the method of claim 2 to 4, characterized in that they have inhibitory effect on the acyl co-enzyme A:cholesterol acyltransferase (ACAT) enzyme.
